

I've installed the Ubuntu VM and ntopng. I configured the ntopng.conf as it was instructed and then I tested it

Screenshots:

A screenshot of a terminal window showing the configuration file `/etc/ntopng/ntopng.conf` being edited with the `nano` text editor. The file contains various configuration options for ntopng, including interface selection, HTTP port, and local network definitions. The terminal window title is `vboxuser@ubuntu: ~/Desktop` and the date/time is `Mar 23 11:59`.

```
GNU nano 7.2 /etc/ntopng/ntopng.conf
# controlled with systemd (e.g., service ntopng start)
#
# -e=
#
# -i|--interface
# Specifies the network interface or collector endpoint to be used by ntopng for network
# monitoring. On Unix you can specify both the interface name (e.g. lo) or the numeric
# interface id as shown by ntopng -h. On Windows you must use the interface number instead.
# Note that you can specify -i multiple times in order to instruct ntopng to create multi-
# ple interfaces.
#
# -i=enp0s3
# -i=eth2
#
# -w|--http-port
# Sets the HTTP port of the embedded web server.
#
# -w=3000
#
# -m|--local-networks
# ntopng determines the ip addresses and netmasks for each active interface. Any traffic on
# those networks is considered local. This parameter allows the user to define additional
# networks and subnetworks whose traffic is also considered local in ntopng reports. All
# other hosts are considered remote. If not specified the default is set to 192.168.1.0/24.
#
# Commas separate multiple network values. Both netmask and CIDR notation may be used,
# even mixed together, for instance "131.114.21.0/24,10.0.0.0/255.0.0.0".
#

```

A screenshot of a terminal window showing the output of the `netstat -antup` command. The output displays active Internet connections, including listening and established connections for various services like `systemd-resolve`, `redis-server`, `ntopng`, and `NetworkManager`. The terminal window title is `vboxuser@ubuntu: ~/Desktop` and the date/time is `Mar 23 11:34`.

```
[sudo] password for vboxuser:
vboxuser@ubuntu:~/Desktop$ sudo netstat -antup
